Abstract

In today's fast-paced world, individuals often struggle to find reliable and up-to-date information about nearby essential services such as clinics, restaurants, salons, grocery stores, and gyms. NearLive is a smart web and mobile platform designed to simplify this process by offering real-time visibility of local businesses' operational status. The application enables users to search, discover, and connect with local service providers based on location, category, or specific keywords. A major highlight of the system is its ability to display whether a service is currently open or closed, based on live updates from business owners, public APIs, and user input. The platform also includes a chatbot powered by AI, voice-based search, user reviews, and aspect-based recommendations derived from sentiment analysis on user feedback, making it an intelligent local assistant for everyday needs.

Existing System

Currently available systems such as **Google Maps**, **IndiaMART**, and **Yellow Pages India** offer partial solutions for service discovery but have significant limitations. Google Maps displays business hours but may not reflect real-time closures or sudden availability changes unless manually updated. IndiaMART is B2B-focused and not user-friendly for common service searches, while Yellow Pages offers only basic directory listings without features like live status, chat, or reviews. These platforms often require businesses to create profiles under specific criteria and do not cater to small or local shops effectively. Moreover, they lack personalized recommendations or chat integration. Thus, there's a strong need for a more dynamic and community-driven service discovery tool.

Proposed System

NearLive addresses the gaps in the existing systems by providing a **real-time, interactive, and AI-enhanced platform** that connects users with nearby services. The system supports user login, smart search by voice or chatbot, detailed service listings, and live operational status updates sourced from business owners and community reports. Business owners can register, manage their visibility, update availability, and communicate directly with customers. The platform incorporates an **aspect-based recommendation system** that uses sentiment analysis to detect key service attributes (e.g., cleanliness, punctuality, pricing) from user feedback and assigns ratings to these aspects. Admins ensure quality control by monitoring listings, handling reports, and preventing misuse. This system helps users save time and make informed decisions while giving local businesses a tool to enhance visibility and engagement.

Modules

1. Admin Module

- Approve or reject business registration requests
- Create and manage service categories and tags
- Monitor and handle user reports or content abuse
- Verify identity and authenticity of service providers
- Moderate reviews and manage reported content
- Track usage data and user engagement metrics
- Ensure compliance with privacy policy and data protection laws
- Dashboard for activity monitoring and system health

2. Service Provider Module

- Register/login as a service provider
- Create a business profile including name, contact, address, map location, and service categories
- Update real-time service availability status (open/closed/busy)
- Upload service images, price lists, offers, and descriptions
- Respond to user messages and service queries
- Receive and respond to reviews
- View aspect-based ratings to identify strengths and areas for improvement

(Eg: Personal Trainers / Gym Module)

- Create gym/personal trainer profile with specializations (e.g., weight loss, yoga, muscle gain)
- Set available training slots and hours
- Allow booking appointments or trial sessions
- Upload trainer certifications, gym facilities, and photos
- Offer pricing packages (monthly/quarterly/yearly)
- Display real-time status (open, closed, full)
- Enable chat for fitness-related queries or schedule changes

- Collect reviews on aspects like cleanliness, trainer professionalism, equipment quality, crowd level, etc.

3.shop owner Module

- Signup
- Login
- Change password
- Work management
- Add highlights of workView
- booking and Confirm
- Manage offer Send notification to user
- View profile and manage
- View payment
- Chat with user
- Show real-time status (busy, available, closed)
- Respond to reviews and track feedback

4. User Module – Functions

- Register/Login
- View and edit user profile
- Search nearby services by name, category, or location
- Filter search results (by rating, distance, open now, offers, etc.)
- View real-time open/close status of services
- View services in list or map view
- Call or chat with service providers
- Book appointments or service slots (if applicable)
- Receive push notifications (offers, updates, reminders)
- Submit reviews and ratings for services
- Aspect-based feedback using sentiment analysis
- View aspect-wise ratings (e.g., cleanliness, price, staff behavior)
- Read, upvote, or report user reviews
- Get personalized service recommendations
- Save services to favorites/bookmarks
- View search and visit history
- Report fake or incorrect listings

- Submit feedback or suggestions for the app
- Manage account settings (password, privacy, theme)
- Control app permissions (location, notifications)
- View and accept terms, privacy policy
-

SYSTEM SPECIFICATION

Hardware Specification

The selection of hardware is very important in the existence and proper working of any of the software. When selecting hardware, the size and capacity requirements are also important. The hardware must suit all application developments.

- Processor :i3 or above.
- System Bus :32 Bit or 64 Bit
- RAM :4GB or Above
- HDD :500 GB or Above
- Monitor :14”LCD or Above
- Keyboard :108 Keys
- Mouse :Any Type of mouse
- Mobile :Android supported mobile phone

Software specification

One of the most difficult tasks is selecting software, once the system requirement is find out then we have to determine whether a particular software package fits for those system requirements. This section summarizes the application requirement.

- Operating System : Windows 7or above.
- Technologies used : python,
- Front end : Html,css,bootstrap,JS
- Back End : Python-Django or Dart-Flutter
- Database : Mysql
- IDE : PyCharm professional,/vs code, Androidstudio
- Web browser

Data Flow Diagram

Data flow diagram is used to define the flow of the system and its resources such as Circle:- which represents a process that transforms incoming data into outgoing flow.information. Data flow diagrams are a way of expressing system requirements in a graphical manner.Data flow diagrams represent one of the most ingenious tools used for structured analysis. A Data flow diagram or DFD as it is shortly called is also known as a bubble chart. It has the purpose of clarifying system requirements and identifying major transformations that will become programs in system design. It is the major starting point in the design phase that functionally decomposes the requirement specifications down to the lowest level of details.A data flow diagram consists of a series of bubbles joined by lines. The bubble represents data transformation and lines represent flow in the system. Inthe normal convention, a Data flow diagram has four major symbols.
